## Breathing Together: Decreasing Air Pollution from Local Heating Systems

Air pollution from local sources (home heating and other residential combustion) exposes population massively to harmful substances. Currently, there is significant lack of data and corrective tools for pollution from small settlements.

The future CONSPIRO project aims at tackling air pollution from local sources, villages, city districts and small settlements. A concept to decrease air pollution will be established through a complex toolset of research, promotion and corrective activities. A methodology for measurement and data analysis will be elaborated and the influence on human health will be assessed.

In the course of the DSPF project, the future project will be developed, the concrete concept elaborated and a partnership established, and a study on existing approaches is conducted.
